PIPELINE PLAN:
- Ask all questions at once
- Example:
    - What is your preference for shedding?
        - Frequent
        - Infrequent
        - Occasional
        - Regularly
        - Seasonal
    - Rank how important this choice is from 1 to 5
- Run a query using all the preferences as rules
- If not enough results are found (like <5):
    - Find the preference (ex - ShedsFrequent(B)) given the least importance
    - Drop the least important preference from the query and rerun
    - Repeat until enough results are found and take the top 5
